Spray polyurethane foam (SPF) is a widely used and highly-effective insulator and sealant; however, eye, skin, and inhalation exposures to its key ingredient, isocyanates, and other chemicals in SPF products of concern in vapors, aerosols, and dusts during SPF installation can cause:

- Asthma, a potentially life-threatening disease
- Lung damage
- Respiratory problems and other breathing difficulties
- Skin and eye irritation
- Other potential adverse health effects

Information on these Web pages is aimed at helping to ensure the safety of SPF applicators and building occupants where SPF is installed. It is also aimed at providing safety and scientific information to professionals in business, non-governmental organizations, academic institutions, and regulatory agencies.

Steps to Control Exposures
Safe work practices should be in place to avoid exposure at every stage of SPF installation. Building occupants and other trade workers not involved in the SPF installation should vacate the premises during installation of various types of SPF products in consultation with the contractor.
To prevent chemical exposures during and after installation, SPF applicators and helpers should use "best practices" based on the type of SPF product applied as recommended by the manufacturer, including:

- Review product ingredients and use information, such as material safety data sheets (MSDSs)
- Vacate building occupants and other trade workers who are unprotected
- Isolate the work site
- Wear prescribed personal protective equipment
  - Chemical resistant (nitrile) gloves
  - Appropriate respirator
  - Chemical resistant clothing
- Ventilate the work site

Clean the area thoroughly before re-entry of unprotected workers or occupants. These "best practices" are a starting point to help professional applicators use SPF products more safely; this Web site will be updated with more specifics on "best practices" as EPA develops them. The two-component high-pressure kit is a professional system and should only be used by a trained applicator. Homeowners who decide to conduct a do-it-yourself project using the two-component low-pressure kit or the one-component can of spray foam should use the same safe work practices, techniques, and precautions that professionals would use. Read more information on the types of SPF products and applications and read the material safety data sheet and product information for proper procedures and appropriate protection specific to each type of application.

**Building Occupants and Other Workers Should Vacate During SPF Installation**

During SPF installation, other trade workers and building occupants should vacate the premises. Re-entry should be restricted until the building has been adequately ventilated and thoroughly cleaned.

Building occupants and unprotected trade workers in buildings where SPF is being installed could be exposed both through their skin and through inhalation to residual vapors, aerosols and dust particles generated during the SPF installation process.

People who enter a building after SPF has been installed could be exposed to residual vapors from “uncured” foam and possibly dust particles bearing isocyanates if the foam was cut or disturbed and if adequate building ventilation and cleaning did not occur prior to re-entry.

“Curing” of SPF means that the chemicals in the product are reacting to produce polyurethane foam. Initially the foam surface will harden or become "tack-free." However, at this stage, the interior of the foam is still curing and still contains unreacted SPF chemicals. Manufacturers estimate that it can take 23-72 hours after application for the foam to fully cure for the two-component high pressure "professional" SPF system. Read the manufacturer’s recommendation for this and other types of SPF products and applications in the material safety data sheet and other product information.
EPA's Spray Polyurethane Foam (SPF) Web Page Continued

The curing time (complete reaction) varies depending on the product formulation, applicator technique, foam thickness, temperature, humidity and other factors. Cutting or trimming foam before it is fully cured may cause exposure to unreacted SPF chemicals.

When is it Safe to Re-Enter after SPF Installation?
It is not clear how much time is needed before it is safe for unprotected workers or building occupants to re-enter. Some manufacturers recommend 23 to 72 hours, but re-entry time is dependent on product formulation and other factors that affect the foam curing time. To determine a safe re-entry time for unprotected applicators, helpers, other workers, and building occupants, such as homeowners and school children, decision-makers should exercise caution. Homeowners, school administrators, and building managers should consult their SPF contractor for specific guidance. In the event that home or building occupants have concerns that they may be exposed to residual SPF chemicals or continue to smell odors, they should contact their contractor to ensure proper procedures and clean-up were followed. If their concerns are not resolved, homeowners or building occupants should contact their local or state consumer protection office or their local or state licensing board for contractors. Consumers can also file an online Consumer Product Incident Report with the U.S. Consumer Product Safety Commission.

Be Aware of Potentially Misleading Marketing Claims
Some advertising claims for SPF do not clearly indicate that these products contain hazardous chemicals. Marketing claims that ignore the presence of isocyanates and other toxic chemicals in SPF insulation mask the need for safe work practices. Read more about chemicals in SPF products. Misleading marketing information can result in spray foam applicators and home and building owners not understanding the need for adequate personal protective equipment and other precautions, such as ventilation, during and after installation. Read more about steps to avoid exposure at every stage of SPF installation.

The Federal Trade Commission (FTC) issued its Guides for the Use of Environmental Marketing Claims, commonly known as the "Green Guides," to help marketers avoid making environmental claims that are unfair or deceptive under Section 5 of the FTC Act. Also relevant are sections 6 and 9. For consumers, the FTC has issued two brochures, “Sorting out ‘Green’ Advertising Claims” and “Eco-Speak: A User’s Guide to the Language of Recycling.” For businesses, the FTC has issued a brochure, “Complying With the Environmental Marketing Guides.”
