As temperatures drop in the autumn many pests will try to seek refuge in buildings to protect themselves from the cold. Here are a few suggestions to help seal school buildings so rodents, beetles, spiders and other pests can’t get in.

1. Check doors for good seals. If light can be seen around edges, then probably a door sweep, threshold or weather stripping is needed.
2. Seal around pipe, wire and other penetrations into the building.
3. Caulk around windows and doors.
4. Use hardware cloth behind attic, roof and crawlspace vents.
5. Seal holes and cracks in the foundation walls.
6. Repair leaks.
7. Clean leaves and debris from gutters.
8. Downspouts should empty into drain pipes to conduct water away from structure.
9. Move mulch up to 18 inches away from foundation base.
10. Remove debris (firewood, boards and other clutter) from the base of buildings.

**IPM Survey Results Are In!**

We’d like to thank everyone that took the time to complete the online UT YEAH IPM Survey that was conducted last spring. Below is a short summary of the results.

**Percentage of schools rated as using no, low, medium or high levels of IPM in their buildings.**

<table>
<thead>
<tr>
<th>No IPM</th>
<th>Low IPM</th>
<th>Medium IPM</th>
<th>High IPM</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>11</td>
<td>20</td>
<td>54</td>
</tr>
</tbody>
</table>

**Percentage of schools rated as using no, low, medium or high levels of IPM on their grounds.**

<table>
<thead>
<tr>
<th>No IPM</th>
<th>Low IPM</th>
<th>Medium IPM</th>
<th>High IPM</th>
</tr>
</thead>
<tbody>
<tr>
<td>72</td>
<td>11</td>
<td>17</td>
<td>0</td>
</tr>
</tbody>
</table>

Only 169 schools, which represents 9.9% of schools and all or part of 6.7% of school districts, responded to this survey. The names of the schools using IPM will be posted on the UT YEAH web site and in future issues of this newsletter.
Bait Fire Ants Around Schools Now While Temperatures Are Between 70 and 90F

Managing Fire Ants with IPM in and Around Schools

I. Long Term Suppression - Two-step method

A. Step 1. Broadcast Bait Application (see additional references for equipment, baits, techniques, etc.). Use an ATV-mounted or handheld spreader to apply fire ant granular bait to large areas (where mound densities are high) once or twice a year (spring and fall, as long as conditions are appropriate for foraging [see tables]).

B. Step 2. Individual Mound Treatments (IMT) should be applied to mounds located in high traffic areas 3 - 10 days after broadcasting a bait

1. Fast-acting granular baits (Advion, Amdro, Ascend, etc.) but don’t leave bait in piles so it is attractive to kids or
2. Pyrethrin or pyrethroid drench (restrict access to treated area until risk of pesticide exposure is removed)

(Note: You may want to apply treatments on a Friday afternoon after school is dismissed if school is still in session. If mounds are located under slabs, sidewalks and other heat sinks, baits are the best option as long as temperatures are between 70 and 90F. Drenches may not contact parts of the colony that are under these objects. Some schools have chosen to apply a nonbait granular fipronil product called TopChoice. TopChoice usually takes 4 weeks to reduce populations to acceptable levels, but may remain active for a year. Some concerns with using TopChoice are that it is more expensive than bait applications, may have more negative effects on nontarget insects, and leaves a chemical residue where students can contact it for over a year.)

II. Immediate Solutions in Sensitive Areas

A. Indoors

1. Notify pest manager of fire ant infestation.
2. Check premises for ant food sources and remove.
3. Use ant bait in a station* or wipe ant trails with soapy water to kill ants and remove trail pheromone or vacuum to remove existing ants (place vacuum bag in sealed plastic bag and place outside in dumpster).
4. Note where fire ants enter the building and provide this information to the pest manager
5. Seal ant entry point into structure with appropriate crack sealers or caulk.
(*Note: Inside schools, pesticides must be applied by a certified technician under the supervision of a licensed operator

B. Outdoors

1. Treat fire ant mound with a liquid drench
   a. botanical insecticide (pyrethrins, d-limonene, etc.) or
   b. pyrethroid insecticide (bifenthrin, cypermethrin, permethrin, etc.) labeled for a fire ant drench

2. Apply a residual insecticide to the ant entry point into the building and seal the entry point, if possible.

3. Restrict access to pesticide-treated areas until risk of exposure is removed from treated area.

**Getting the Most from Fire Ant Baits**

- Baits should be applied between 70 and 90 degrees F when maximum fire ant foraging occurs.
- In summer, apply baits in the evening. During the cooler evening, ants will quickly discover and carry off baits. If applied during the day, in extreme heat, baits quickly lose their effectiveness. Also, ants do not forage much during the day when it is too hot (>90 degrees F).
- To see if ants are active, place a small amount of food (hot dog or potato chip) next to a mound. If ants begin removing the food within 30 minutes, it’s a good time to treat.
- Use only fresh bait, preferably from an unopened container. Once opened, baits should be used within a few weeks. Unopened containers may stay fresh for up to two years.
- Test baits for freshness before using. Sprinkle a small amount next to an active mound. If the bait is fresh, ants will begin removing it within 30 minutes. If ants do not remove the bait, but feed on the potato chip, then the bait is spoiled.
- Apply baits when no rain or dew is expected for at least five hours. Once the baits become soggy, they are not as attractive to the ants.
- Broadcast the bait, or apply it as directed around, NOT ON, the mound.
- Avoid disturbing the ants right before applying the bait.
- Do not contaminate baits by storing them or applying them with fertilizer or other pesticides.
- Follow the directions on the label. It is against the law to apply baits in areas not listed on the label.
To protect people and the environment, pesticides should be used safely. This is everyone's responsibility, especially the user. Read and follow label directions carefully before you buy, mix, apply, store or dispose of a pesticide. According to laws regulating pesticides, they must be used only as directed by the label.
